## ABBREVIATIONS AND ACRONYMS

---

AFP	Acute flaccid paralysis
GAPIV	Global Action Plan IV for Poliovirus Containment
nOPV	Novel oral polio vaccine
nOPV2	Novel oral polio vaccine type 2
OPV	Oral polio vaccine
bOPV	Bivalent oral polio vaccine (containing attenuated Sabin poliovirus type 1 and type 3)
mOPV2	Monovalent oral polio vaccine type 2
OPV2	Oral polio vaccine type 2
tOPV	Trivalent oral polio vaccine (containing attenuated Sabin poliovirus type 1, type 2 and type 3)
SIA	Supplementary immunization activity
VDPV	Vaccine-derived poliovirus
cVDPV	Circulating vaccine-derived poliovirus
cVDPV1	Circulating vaccine-derived poliovirus type 1
cVDPV2	Circulating vaccine-derived poliovirus type 2
WHO	World Health Organization
WPV	Wild poliovirus
WPV1	Wild poliovirus type 1
WPV2	Wild poliovirus type 2
WPV3	Wild poliovirus type 3

# COUNTRY- AND AREA-SPECIFIC POLIOVIRUS DATA, JUNE 2024

## UPDATE

---

Facilities are encouraged to use Table A2.1 in this document in conjunction with *Poliovirus containment: guidance to minimize risks for facilities collecting, handling or storing materials potentially infectious for polioviruses, second edition*, to assess the risk of sample collections potentially infectious for poliovirus.

Identifying all laboratory samples at risk for containing poliovirus is essential for securing a polio-free world. The presence of poliovirus in a given country can only be ruled out with active acute flaccid paralysis (AFP) and environmental surveillance. The data and information shown in Table A2.1 were collected from multiple sources using the following algorithm for each country:

- The data were derived from national poliovirus reports and a systematic literature search in consultation with WHO regional offices. Resulting dates of reported indigenous wild poliovirus (WPV) circulation, and WPV outbreak and circulating vaccine-derived poliovirus (cVDPV) outbreak circulation were recorded in the table.
- If no dates were reported for a specific type of poliovirus in a given country, the date of the last reported clinically confirmed poliomyelitis case was used. Clinically confirmed cases were poliomyelitis cases diagnosed by medical doctors without virological confirmation, so the case may have been caused by any of the three types of WPV and no type can be excluded.
- If no dates were reported for a specific type of WPV in a given country and no clinically confirmed cases were reported, the date of the last reported case of that WPV type in the country's WHO region was used or the date national AFP surveillance began, whichever date was earliest.

Table A2.1 is regularly revised and updated.

WHO makes no warranties regarding the content, completeness or accuracy of the data and information, and shall not be held liable for any damages whatsoever resulting from their use or application.<sup>1</sup>

### How to use this table

1. For a given stool, respiratory or concentrated sewage sample, determine the country of origin and date of collection. If this information is unknown, the sample should be destroyed or inactivated using a method known to inactivate poliovirus.
2. For each sample of known origin and date of collection, refer to the country of origin in the table. According to the date of collection, determine under which column the sample falls. If the sample falls under the column:
  - a. **WPV/VDPV potentially infectious material dates**,<sup>2</sup> the sample must be destroyed, inactivated or handled under full Global Action Plan for Poliovirus Containment (GAPIV<sup>3</sup>).
  - b. **OPV2/nOPV2/Sabin2 potentially infectious material dates**, the sample is considered oral polio vaccine type 2/novel oral polio vaccine type 2/Sabin2 (OPV2/nOPV2/Sabin2) potentially infectious material and may only be handled outside of GAPIV containment under the specific conditions outlined in this Guidance.

---

<sup>1</sup> Please contact [containment@who.int](mailto:containment@who.int) for any comments or questions.

<sup>2</sup> This column includes the dates of indigenous WPV circulation, WPV outbreaks and cVDPV outbreaks.

<sup>3</sup> WHO Global Action Plan for Poliovirus Containment: GAPIV (unedited version). Geneva: World Health Organization; 2022 (<https://polioeradication.org/wp-content/uploads/2022/07/WHO-Global-Action-Plan-for-Poliovirus-Containment-GAPIV.pdf>, accessed 4 June 2024).

## Table A2.1: Important notes

**All dates:** Table dates include month and year of circulation for any given virus type. If the specific month of an end date was unknown, December is the default month.

**WPV/cVDPV potentially infectious material column dates:** The dates for circulation of any of the three WPV types in each country are listed in this table.

The column's orange highlighting indicates that samples collected during these dates require immediate action. All WPV/cVDPV infectious or potentially infectious material must be destroyed, inactivated or handled/stored in containment as described in GAPIV, except in Afghanistan and Pakistan, where the containment of wild poliovirus type 1/circulating vaccine-derived poliovirus type 1 (WPV1/cVDPV1) is not required yet.<sup>4</sup>

The blue highlighting indicates that all samples collected from WPV1-endemic Afghanistan or Pakistan must be destroyed, inactivated or handled/stored in containment as described in GAPIV if retained in other countries.

The column under this heading lists the last known dates of 1) indigenous WPV; 2) outbreak WPV; and 3) cVDPV for any type. Indigenous circulation dates are listed as "until" a specified date, and samples collected on preceding dates, including the last indicated month, are WPV potentially infectious material unless they have been identified as poliovirus infectious.

WPV and cVDPV outbreaks include a start and end date and any samples collected during this time frame are considered WPV potentially infectious material. cVDPV outbreak dates are indicated in italics. Bold countries and dates indicate ongoing WPV or cVDPV outbreaks, or ongoing circulation at the time of publication. WPV or cVDPV outbreaks are declared closed when no WPV/cVDPV is isolated for more than 12 months. The table will then indicate, retroactively, the date of the last isolation. Dates of single cases of WPV importation, ambiguous vaccine-derived poliovirus cases and immunodeficiency-associated vaccine-derived poliovirus cases are not included in this table.

As of June 2024, WPV1 is still endemic in two countries: Afghanistan and Pakistan. WPV1 was imported into some countries in the WHO African Region between November 2021 and August 2022 but has not been detected since.

cVDPV1 is present in some countries/areas in the African Region and circulating vaccine-derived poliovirus type 2 (cVDPV2) is present in the WHO African and Eastern Mediterranean Regions. In response, supplementary immunization activities (SIAs) with monovalent oral polio vaccine type 2 (mOPV2), novel OPV2 (nOPV2), trivalent oral polio vaccine (tOPV) and/or inactivated polio vaccine are being organized in these areas, while bivalent oral polio vaccine (bOPV) is still used for routine immunization in all regions. Since the switch in 2016, approximately 2.37 billion doses of type-2-containing oral polio vaccine (OPV) – 690 million mOPV2 doses, 199 million tOPV doses and 1.482 billion nOPV2 doses – have thus far been released from the global OPV stockpile in Africa and other regions.<sup>5</sup>

**OPV2/nOPV2/Sabin2 potentially infectious material column dates:** This column's orange highlighting indicates that samples collected during these dates require immediate action. OPV2/nOPV2/Sabin2 potentially infectious material may be handled outside GAPIV containment only under the specific conditions outlined in this Guidance.

WHO vaccination databases and national reports were consulted to determine the dates of OPV2/nOPV2/Sabin2 circulation. The OPV2/nOPV2/Sabin2 potentially infectious material dates for a country or area generally start immediately following the last known dates of circulation of any

---

<sup>4</sup> Summary Report from the Twenty-fourth Meeting of the Global Commission for Certification of Poliomyelitis Eradication, Geneva, 22–23 November 2023. Geneva: World Health Organization; 2024 (<https://polioeradication.org/wp-content/uploads/2024/05/Twenty-fourth-Meeting-of-the-Global-Commission-for-Certification-of-Poliomyelitis-Eradication.pdf>, accessed 5 June 2024).

<sup>5</sup> Internal WHO communication of reported doses as of June 2024

WPV/cVDPV. The year of tOPV introduction.<sup>6</sup> and month and year of last tOPV use<sup>7</sup> are indicated for each country in the footnotes. To define the end dates of OPV2/nOPV2/Sabin2 circulation, three months were added to the last known use of tOPV/mOPV2/nOPV2 in each country or area. In the absence of evidence showing otherwise, samples collected after the dates listed in this table are not considered OPV2/nOPV2/Sabin2 potentially infectious material.

It must be emphasized that samples collected during dates of WPV/cVDPV circulation are considered WPV potentially infectious material, which presents a higher risk than OPV/novel oral polio vaccine (nOPV)/Sabin potentially infectious material.

This Web Annex A must be read in conjunction with *Poliovirus containment: guidance to minimize risks for facilities collecting, handling or storing materials potentially infectious for polioviruses, second edition*.

---

<sup>6</sup> The year of tOPV introduction is generally not known. For this reason, the table assumes that materials collected between the last listed WPV case and three months after the last use of tOPV, excluding periods with VDPVs, would fall under the category of OPV2/nOPV2/Sabin2 potentially infectious material.

<sup>7</sup> In countries and areas where only the year is known, the month of last tOPV use was arbitrarily set as December.

**Table A2.1. Country- and area-specific poliovirus circulation data, June 2024 update**

No.	Country or area	1. WPV/VDPV potentially infectious material dates Types 1, 2 or 3 (Must contain now)	2. OPV2/nOPV2/Sabin2 potentially infectious material dates (Must mitigate now)
